Experience

- **Jubilant FoodWorks (Domino's India)** **January 2023 – Present**

  Senior Software Engineer *August 2025 – Present*
  - Built a multi-tenant Campaign Engine (Java, Spring Boot) on a custom rule core for priority execution and cohort targeting, absorbing 100+ campaign changes a quarter with zero deployments; its campaigns lifted new-user conversion ∼16% in month 1.
  - Cut p99 latency from 29.4ms to 5.8ms (80%) and average latency from 14.6ms to 2.6ms on a service that peaks at 155K requests per minute, by removing an N+1 query and adding an in-memory cache.
  - Automated operational-load mitigation across a fleet of 2,500+ stores, by building a real-time evaluation platform that ingests live customer, rider and order events through Kafka scores per-store load against a predictive model, and triggers graduated mitigations over RabbitMQ.
  - Added 4+ payment and partner integrations: TWID loyalty points as a new tender across cash, card, UPI and wallet flows, plus Razorpay, VIPL eVoucher and Swiggy Toing.
  - Moved corporate ordering off an offline, manually handled process onto a self-serve platform that takes orders of up to 1,000 unique items in any quantity without adding load to store systems.

  Software Engineer *July 2023 – July 2025*
  - Built the platform that handles every customer communication adopted across all 5 JFL brands, replacing 11+ isolated vendor integrations in Domino's India with no fallback. The multi-tenant, event-driven system on Kafka and Spring Boot serves SMS, Push, Email, WhatsApp and Live activities, with template management, multi-vendor fallback, and every request tracked for billing and audit. Handles millions of requests a day, peaking at 134K per minute.
  - Reduced MongoDB query latency from 18.7ms to 3.9ms (79%) on the notification hot path by profiling queries, redesigning indexes and trimming projections. Traffic later grew on the same infrastructure.
  - Rebuilt the Domino's - IRCTC train ordering backend end to end on a template-driven design expanding reach through Zomato, raising flow conversion 230 bps and train order volume 25%.
  - Shipped a flat-price menu with time and region controls and A/B testing across user segments, driving up to 49% more campaign-driven conversions.

  Graduate Engineering Trainee *January 2023 – June 2023*
  - Added Resilience4j circuit breakers to 3 core order-processing services and upgraded Java and Spring Boot across 8+ services.
  - Moved dependency scanning into CI/CD using OWASP Dependency-Check across 8+ services and fixed the high-severity CVEs it surfaced.

- **Standard Chartered** **2022**

  Technology Intern
  - Built an in-house Java validator for corporate payment files in 2 formats, JSON and CSV, replacing a third-party tool, with a React interface that showed which records failed and why.

Languages & Technologies

- **Languages**: Java, C++, SQL
- **Backend & Distributed Systems**: Spring Boot, Kafka, RabbitMQ, Resilience4j, Spring Batch, REST APIs, Microservices, Event-Driven Architecture, System Design
- **Databases & Storage**: MySQL, MongoDB, Aerospike, Elasticsearch
- **Cloud, DevOps & Observability**: AWS, Docker, CI/CD, Git, New Relic, Datadog, Grafana, CubeAPM

Awards

- **5× Silver Award** — TWID pay-by-rewards integration; campaign and delivery-charge platform; cross-brand notification platform; Domino's–Zomato IRCTC integration; multi-tenancy platform program
- **Star Employee** — recognized for impact on the notification platform and train-ordering launches
- **Chairperson's Award Nominee 2025** — Best Market Maker of the Year, for the flat-price menu capability

Education

- **National Institute of Technology, Jamshedpur** **2023**

  B.Tech with Honors, Computer Science and Engineering — CGPA: 8.44/10 *Jamshedpur, India*

Projects

- **Hurdler 2.0** — An e-learning tool that visualizes Dijkstra's algorithm in action — build your own walls, add hurdles and weights, and watch the path finding run.
